Chapter 1: Ferns

Observation 1.1: the fronds by the trail; spores gather under each frond in brown clusters called sori.

Observation 1.2: the fronds by the trail; spores gather under each frond in brown clusters called sori.

Observation 1.3: the fronds by the trail; spores gather under each frond in brown clusters called sori.

Observation 1.4: the fronds by the trail; spores gather under each frond in brown clusters called sori.

Observation 1.5: the fronds by the trail; spores gather under each frond in brown clusters called sori.

Observation 1.6: the fronds by the trail; spores gather under each frond in brown clusters called sori.

Observation 1.7: the fronds by the trail; spores gather under each frond in brown clusters called sori.

Observation 1.8: the fronds by the trail; spores gather under each frond in brown clusters called sori.

Observation 1.9: the fronds by the trail; spores gather under each frond in brown clusters called sori.

Observation 1.10: the fronds by the trail; spores gather under each frond in brown clusters called sori.

Observation 1.11: the fronds by the trail; spores gather under each frond in brown clusters called sori.

Observation 1.12: the fronds by the trail; spores gather under each frond in brown clusters called sori.

Observation 1.13: the fronds by the trail; spores gather under each frond in brown clusters called sori.

Observation 1.14: the fronds by the trail; spores gather under each frond in brown clusters called sori.

Chapter 2: Mosses

Observation 2.1: the cushions by the trail; a moss cushion holds water like a sponge after rain.

Observation 2.2: the cushions by the trail; a moss cushion holds water like a sponge after rain.

Observation 2.3: the cushions by the trail; a moss cushion holds water like a sponge after rain.

Observation 2.4: the cushions by the trail; a moss cushion holds water like a sponge after rain.

Observation 2.5: the cushions by the trail; a moss cushion holds water like a sponge after rain.

Observation 2.6: the cushions by the trail; a moss cushion holds water like a sponge after rain.

Observation 2.7: the cushions by the trail; a moss cushion holds water like a sponge after rain.

Observation 2.8: the cushions by the trail; a moss cushion holds water like a sponge after rain.

Observation 2.9: the cushions by the trail; a moss cushion holds water like a sponge after rain.

Observation 2.10: the cushions by the trail; a moss cushion holds water like a sponge after rain.

Observation 2.11: the cushions by the trail; a moss cushion holds water like a sponge after rain.

Observation 2.12: the cushions by the trail; a moss cushion holds water like a sponge after rain.

Observation 2.13: the cushions by the trail; a moss cushion holds water like a sponge after rain.

Observation 2.14: the cushions by the trail; a moss cushion holds water like a sponge after rain.

Chapter 3: Lichens
Observation 3.1: the crusts by the trail; lichen is a partnership of a fungus and an alga on bare rock.
Observation 3.2: the crusts by the trail; lichen is a partnership of a fungus and an alga on bare rock.
Observation 3.3: the crusts by the trail; lichen is a partnership of a fungus and an alga on bare rock.
Observation 3.4: the crusts by the trail; lichen is a partnership of a fungus and an alga on bare rock.
Observation 3.5: the crusts by the trail; lichen is a partnership of a fungus and an alga on bare rock.
Observation 3.6: the crusts by the trail; lichen is a partnership of a fungus and an alga on bare rock.
Observation 3.7: the crusts by the trail; lichen is a partnership of a fungus and an alga on bare rock.
Observation 3.8: the crusts by the trail; lichen is a partnership of a fungus and an alga on bare rock.
Observation 3.9: the crusts by the trail; lichen is a partnership of a fungus and an alga on bare rock.
Observation 3.10: the crusts by the trail; lichen is a partnership of a fungus and an alga on bare rock.
Observation 3.11: the crusts by the trail; lichen is a partnership of a fungus and an alga on bare rock.
Observation 3.12: the crusts by the trail; lichen is a partnership of a fungus and an alga on bare rock.
Observation 3.13: the crusts by the trail; lichen is a partnership of a fungus and an alga on bare rock.
Observation 3.14: the crusts by the trail; lichen is a partnership of a fungus and an alga on bare rock.

Chapter 4: Liverworts

Observation 4.1: the thalli by the trail; liverworts spread as flat green thalli along stream banks.

Observation 4.2: the thalli by the trail; liverworts spread as flat green thalli along stream banks.

Observation 4.3: the thalli by the trail; liverworts spread as flat green thalli along stream banks.

Observation 4.4: the thalli by the trail; liverworts spread as flat green thalli along stream banks.

Observation 4.5: the thalli by the trail; liverworts spread as flat green thalli along stream banks.

Observation 4.6: the thalli by the trail; liverworts spread as flat green thalli along stream banks.

Observation 4.7: the thalli by the trail; liverworts spread as flat green thalli along stream banks.

Observation 4.8: the thalli by the trail; liverworts spread as flat green thalli along stream banks.

Observation 4.9: the thalli by the trail; liverworts spread as flat green thalli along stream banks.

Observation 4.10: the thalli by the trail; liverworts spread as flat green thalli along stream banks.

Observation 4.11: the thalli by the trail; liverworts spread as flat green thalli along stream banks.

Observation 4.12: the thalli by the trail; liverworts spread as flat green thalli along stream banks.

Observation 4.13: the thalli by the trail; liverworts spread as flat green thalli along stream banks.

Observation 4.14: the thalli by the trail; liverworts spread as flat green thalli along stream banks.

Chapter 5: Horsetails

Observation 5.1: the rhizomes by the trail; horsetails rise from rhizomes and their stems feel like sandpaper.

Observation 5.2: the rhizomes by the trail; horsetails rise from rhizomes and their stems feel like sandpaper.

Observation 5.3: the rhizomes by the trail; horsetails rise from rhizomes and their stems feel like sandpaper.

Observation 5.4: the rhizomes by the trail; horsetails rise from rhizomes and their stems feel like sandpaper.

Observation 5.5: the rhizomes by the trail; horsetails rise from rhizomes and their stems feel like sandpaper.

Observation 5.6: the rhizomes by the trail; horsetails rise from rhizomes and their stems feel like sandpaper.

Observation 5.7: the rhizomes by the trail; horsetails rise from rhizomes and their stems feel like sandpaper.

Observation 5.8: the rhizomes by the trail; horsetails rise from rhizomes and their stems feel like sandpaper.

Observation 5.9: the rhizomes by the trail; horsetails rise from rhizomes and their stems feel like sandpaper.

Observation 5.10: the rhizomes by the trail; horsetails rise from rhizomes and their stems feel like sandpaper.

Observation 5.11: the rhizomes by the trail; horsetails rise from rhizomes and their stems feel like sandpaper.

Observation 5.12: the rhizomes by the trail; horsetails rise from rhizomes and their stems feel like sandpaper.

Observation 5.13: the rhizomes by the trail; horsetails rise from rhizomes and their stems feel like sandpaper.

Observation 5.14: the rhizomes by the trail; horsetails rise from rhizomes and their stems feel like sandpaper.
